

The generation of slab formwork GRIDFLEX with a completely new safety

25 April 2015 by PERI

Gold medal by Batimat Innovations 2007

PERI GRIDFLEX is the flexible slab formwork system complete with accessible girder grids. Due to the lightweight aluminium components and pre-determined assembly sequence, very short shuttering times are achieved. Telescopic filler elements ensure maximum flexibility.

Safe: With the systematic assembly sequence, elements are simply hooked in at one end from below and swivelled upwards at the other. The girder grid design of the GRIDFLEX automatically forms an accessible working area which provides a high level of safety when laying the plywood sheets.

Only 3 components

The standard field is formed using only three system parts: elements, prop head and plywood. Easy to handle parts - an element weighs approx. 10 kg/m²

Flexibility: With only three kind of panel (standard, telescopic filler longitudinal and transverse), the GRIDFLEX, simple labour-saving filler areas can be realized for any building shape. Compensations are quickly carried out and adjusting to the requirements.

New : On Intermat, PERI presents the new lateral safety guardrail
