

New Mobile Application for hay/silage making: KUHN ForageXpert

8 April 2015 by KUHN

Many farmers already use agricultural applications for Smartphones (in France, they represent close to 70 %, according to recent studies).

By offering innovative mobile applications, KUHN group perfectly meets farmers' expectations in terms of new technologies. In this respect, we present « KUHN ForageXpert », the new mobile application for hay/silage making equipment of the KUHN brand.

When a farmer wishes to replace a hay tool, it is important that he checks if his future equipment (mower/tedder or rake) is compatible with the other machines present on his farm. In a few clicks, the application provides a diagram of the swaths produced by the mower in order to find the best tedder and/or rake combination corresponding to the required working width. For each selected equipment, the application provides the details of all KUHN machines which correspond to the farmer's request as well as a short description for each of these tools.

Other functions have also been integrated in the application. The user can for example save the most appropriate combination results and send them to a close relation using his smartphone mailbox. By clicking on the photo of the desired machine model, he can access all technical information available on the KUHN website.

This application is available free of charge for Androïd and iOs, and be used on smartphones as well as tablets.
