

Plant with confidence: GENIUS MASTER & EASY-CON technology

24 October 2015 by Maschio Gaspardo

Gaspardo engineers developed a new Isobus software for seed drills (GENIUS CERAL MASTER) and for precision planters (GENIUS PRECISION MASTER) to know exactly how your planter/seeder is performing in real-time directly from the tractor monitor or your office. User-friendly lay-out provides a clear overview of how your planter is operating straight from the seed sensor. This software features on-the-go planting performance for many vital planting areas, including population (actual population, target population), spacing (seed spacing CV) and singulation. Receiving real-time singulation data from the row units, this software elaborates information about the row units with the highest percentage of seed multiples and skips allowing you to make adjustments and improve your plant emergence.

Moreover, GENIUS MASTER allows you to view in-cab ground speed, total worked area, vacuum level, perform a fast and precise fertilizer/seed rate calibration (for seed drills or planter equipped with fertilizer) or change seeding rate on the go. Thank to EASY-CON software, you have the possibility to transfer all data on other devices (mobile, tablet) and check them on your operations center remotely.
