

ROTARYSTAR – the new rotary hoe from Einböck

30 November 2015 by Einböck GmbH & CoKG

High productivity, versatility and perfect soil adaptation are the keywords for the new ROTARYSTAR of Einböck.

One of the most important advantages of the Einböck ROTARYSTAR are certainly the rotating working tools (finger stars), therefore breaking and crumbling of crusts which came up after heavy rains are more effective. Optimal aeration of the soil and stimulation of crop growth are guaranteed. Also in mulch-till-cultures the rotary hoe has great advantages, as the rotating fingers avoid piling of residues.

The ROTARYSTAR can be used for various cultures. The machine shows extremely high efficiency due to the high working speed of 12 – 25 km/h. The stars are mounted on torsion springs on 1.5 m large sections in 2 rows. The pressure on the elements can be varied depending on the circumstances during operation by hydraulically adjustable parallelograms. Further this hydraulic system allows hydraulic levelling therefore even on very uneven fields the same working depth over the whole working width can be obtained. The tight distance of the discs of only 9.4 cm/ 3.7 inch and the high speed ensures working of the full field surface. Lightly enrooted weeds do not have a chance.
