

Stubble cultivation with Einböck

13 November 2015 by Einböck GmbH & CoKG

Purpose of stubble cultivation is fast mixing in of crop shortfall, combating weeds and working in of seeds which should be improved to germination. Quickest possible stubble cultivation avoids evaporation and develops ideal conditions to accelerate reduction of plant shortfall and to prepare soil for next seeding.

Reliable classic: HURRICANE and TWISTER

Stubble cultivation serves as preparation of tillage and has to adjust to next main crop in working depth. Einböck classics' TWISTER and HURRICANE yield best results for years – both at shallow and deep tillage. The possible mixing effect is the determining factor for good incubation and correct straw rotting. Costs of engery and wearing can be saved by correct stubble cultivation and working time can be reduced.

The **4-row universal cultivator HURRICANE** of Einböck convinces in all areas of application. For both, shallow tillage with wing shares or deep tillage with narrow shares, the HURRICANE is completely in its element. The tight line distance guarantees a complete loosening of the soil and perfect mixing effect without blocking. The specially shaped tine saves smooth running of the cultivator and avoids filling pores of the soil.

The **short disc harrow TWISTER** is an extremely compact and versatile universal machine. The TWISTER therefore is suitable for working on small and large farms, independently from field-sizes. With an optimal operation speed of 10-15 km/h the best mixing is reached. This universal machine is also suited for seed bed preparation beside stubble cultivation. An impressive daily performance and a reduction of the operation processes will astonish you. The Einböck TWISTER works most effectively in a working depth of 4-12 cm.

Modern stubble-experts: TAIFUN and MULTISOILER

The lightweight **universal cultivator TAIFUN** is a versatile all-rounder. The TAIFUN can be used for soil preparation – especially for areas with winter greening. The incorporation of liquid and farmyard manure and a light or second stubble cultivation and the combat of twitch grass are no problem for the TAIFUN. Working width of up to 12 m is available.

The light **universal cultivator MULTISOILER** is a spring-tooth cultivator especially designed for smooth soil treatment. The most important plus of the trailed 6-row multi-talent with 5, 6 or 7 m working width are its

manoeuvrability, ease to pull, high efficiency and effectiveness. The cultivator with its strong Kronos-tines (made of 90x13 mm high-strength, stainless spring steel) permits an under beam clearance of 580 mm. Even in conditions with much crop residues blocking is no problem. Thanks to the perfect tine distribution on 6 rows – even by a narrow line distance of only 16 cm. The additional support wheels in front on the side wings guarantee an exact depth control.

Suitable rear rollers

Exact tools of rear rollers are important to guarantee fast and constant germination. Einböck has for every tool and soil condition the adequate rear roller. We offer mechanic and pneumatic seeders to spread catchcrops, fine seeds and so on. The seeders can be mounted on all on the market existing machines for stubble cultivation.
