

Versatile Giant skid steer in full production

15 February 2016 by TOBROCO-GIANT

GIANT revealed its first skid steer loader during the GIANT open days in October 2014. After more than a year of development and testing the little GIANT is ready for production. Especially for this range of compact machines we have built a new and modern production line at the end of 2015. Since January of this year, the line is in full production.

It's clear that these powerful and all-round machines are the right expansion of the current range of machinery. The first machines are already delivered to dealers in Germany, Switzerland, The Netherlands, Denmark and United Kingdom.

GIANT skid steer loaders combine a low weight (750 kg) and compact sizes with a high tractive force and tipping load. This makes the machines extremely flexible and suitable to use for different areas of application. Together with a wide range of attachments it is possible to adjust a GIANT skid steer loader to working conditions for agricultural purposes, (road) construction, property maintenance or for private use.

The current range of skid steer loaders exists of 3 different models. One gasoline version with 21 HP (SK 211 G) and two diesel versions with 20 HP (SK 201 D) or 25 HP (SK 251 D). The machines are equipped with 4 powerful hydraulic wheel motors, which have a low need of maintenance.
