

Specific arboricultural slurry tanker

27 September 2016 by JOSKIN

Boost your fruit yields at lower costs !

Especially designed and manufactured at Joskin for arboriculturists, this tanker provides solutions to professionals who want to increase their output by fertilizing orchards with slurry or water.

The structure has been designed to reduce the **width** to the minimum (**1300 mm** with 15.0/55-17 TL AW tyres) to avoid damages to branches when placing liquid at the base of the trees. All components such as tyres, pump, valves, hose carrying hooks and lights are perfectly integrated. At the rear of the tanker, the specific **double outlet** – both equipped with ball valves – is fed via a hydraulic valve operated from the tractor.

Its **robustness** and reliability are guaranteed thanks to the Joskin experience (more than 34000 tankers sold through the world).

This specific tanker model is based on the Modulo, it is fully galvanized, has a robust conception, a low center of gravity and offers a good weight/ quality ratio.

The tanker is welded (on its width and length) on a full frame on which the pulling stresses are concentrated.

The tanker is fitted with a vane pump (vacuum system) which offers good value for money, low wear, **low maintenance costs** and flexible use.
