

MONDIALE 120 COMBI – combined round baler with wrapper

23 February 2017 by Maschio Gaspardo

MONDIALE 120 COMBI is the ideal solution for the collection of green product (rye grass and alfalfa): the product is sized, packed and wrapped in a single operation. So, the bale will not be contaminated through contact with the ground or with adverse weather, and improving animal health.

The machine also enables a single passage to be made in the field, minimising soil trampling and reducing working time and fuel consumption. The round baler features a gentle wrapping system, which envelops the bale in a plastic film, protecting it from contact with the air and with other external agents. This prevents any aerobic fermentation, for optimal product conservation, even when damp, and improving animal health.

TOP QUALITY

Thanks to the generous pick up and to the feeder system, collection of the product is always efficient, respecting both the type of product and the degree of wetness thereof. The fixed chamber is equipped with rollers, which allow for the product to be pressed without excessive strain, reducing the degree of loss usually seen.

ALL IN A SINGLE PASSAGE

This combined baler enables operators to complete the collection and wrapping process without stopping, considerably reducing working time. Operations are managed directly from the tractor cab, where the operator can control the functions of the baler (pick up, pressing, tying, bale unloading) and the wrapper (rpm, rotation speed, unloading).
