

GO FASTER compact loader unveiled by JCB

20 February 2017 by JCB

JCB is to offer both high travel speed and high traction options for its popular 407 compact wheeled loader. The driveline options further enhance the versatility and performance of this highly productive machine.

The high-speed axle option will deliver maximum travel speeds of up to 35kph and will sit alongside the existing 20kph axle option. The higher speed axles are available in standard open differential format or with a limited slip differential in the front axle, for improved loader performance.

Operation is similar to the larger 409 compact wheeled loader, with the existing two-mode rocker switch on the joystick and a second high-speed rocker switch located on the right hand console. This switch controls the increase in speed from 20-35kph. The higher speed machine features a 150mm longer wheelbase and an additional 100kg in operating weight.

JCB will also offer a locking differential front axle for the 407, available with both 20kph and 35kph options. To use the front diff-lock, the operator simply holds down a diff-lock activation switch on the loader joystick for the time that they require the axle to be locked. This prevents the axle lock remaining activated when it is not required.

The JCB 407 is a 1.0m³ compact wheeled loader, with an operating weight of 5,097kg. Powered by an efficient 48kW (64hp) JCB Diesel by Kohler engine, the 407 has a two-speed hydrostatic transmission for easy operation. Equipped with a spacious, comfortable operator's cab, the 407 is a highly versatile loading shovel and materials handling solution.
