

Vacall AllJetVac R Series available with Recycler option

10 March 2017 by GRADALL Industries

The Vacall AllJetVac R Series machines address an industry preference for rear reel positioning in high performance sewer cleaning. Equipped with a Recycler option, the AllJetVac can further improve productivity while saving up to 5.7 million gallons of water each year.

Designed, built and supported by Gradall Industries, Inc., AllJetVac R series delivers excellent jetting action and superior vacuum power to open clogged sewer lines and perform needed routine maintenance quickly and efficiently.

The R Series model, with a rear-mounted hose reel and boom, accommodates operators who prefer to work away from engine noise. The rear hose wheel delivers jetting action in any direction with an optional axial pivoting base.

The Recycler option is available on AllJetVac models with either front or rear-mounted hose reels, letting you work all day without stopping for water refills. Water is vacuumed from sewer lines, put it through a five-step filtering process, and then used for jetting back through the line. By eliminating refill trips, fuel is saved, as does the ability to operate a truck that's light in weight because it is not carrying water.

The Recycler option is a part of the Vacall "Green that Works" package of advantages, including the AllSmartFlow CAN bus intelligent control system which is standard on all AllJetVac models. AllSmartFlow improves working efficiency by providing the operator with precise LCD controls to monitor and manage water flow.

Unlike other machines, AllJetVac models use just one engine instead of two for chassis mobility and to generate optimum vacuum and jetting power. This feature can save on fuel consumption, routine service, harmful emissions and the purchase price of the unit.

Vacall machines are built to last, and to assure long equipment life AllJetVac machines have rugged, oval-shaped debris bodies with cylindrical sides, designed for extra strength and efficient material dumping. Water tanks are fabricated from high-quality aluminum, mounted to avoid road debris damage. To ensure the longevity of your machine, Vacall galvanized debris bodies and aluminum water tanks carry a lifetime warrantee.

To customize the models for specific applications and preferences, contractors and municipalities can choose decant valves, cold water recirculation system, backup hose reel hydraulics, multiple blower and water pump choices including a proprietary 87 gpm /2000 psi water pump with 30-minute run-dry guarantee. Debris tank capacities are offered in 6, 8, 10 and 12 cubic yards. Water tank capacities include 1,000, 1,200 and 1,500 gallons.
