

New products from SKF

20 November 2017 by Elmia AB

SKF is launching a series of new products on the Swedish market at Elmia Subcontractor 2017. The focus is on efficient rotation and increased operational safety.

The CASM-100 electromagnetic actuator, angular contact ball bearings with Explorer performance, the latest generation of electrically insulated bearings and the compact and powerful CAHB-22 actuator. These are the new products that SKF is presenting at its stand at Elmia Subcontractor.

The CAHB-22 is a compact replacement for hydraulic cylinders for machines in tough environments such as farming and construction plant equipment. The actuator can handle one tonne in dynamic load and two tonnes in static load.

"The advantage with the actuator is the compact solution with a lot of power in a small built-in size. Above all, it provides good resistance in tough environments," explains Jörgen Wingårdh, Key Account Manager at SKF.

Elmia Subcontractor is an important business venue for SKF and the days here have been filled with productive customer meetings. "Elmia Subcontractor has been hugely successful for us this year with over 200 pre-booked visits to the stand, which is really good," says Johan Fritzson, Key Account Manager på SKF.
