

Long-lasting and flexible: New cold-water HD trailer from Kärcher

9 February 2019 by Kärcher

High-pressure mobility

A 1000-litre water tank, a powerful diesel or petrol engine and well-thought-out options – the new cold-water high-pressure trailer from Kärcher allows mobile, self-sufficient working. Without water tank refilling, it can operate for a least one hour in continuous work mode. The low support load of 75 kilogrammes obviates the need for larger towing vehicles. Thanks to options such as impact protection for the tank, a hose reel or an hour meter, the trailer can be configured for customer-specific requirements. This flexibility benefits municipalities, the building industry, cleaning service providers and rental fleets.

After the successful introduction of its hot-water HP trailer, Kärcher now completes its product range for mobile applications with the cold-water models. The pump and engine come from existing products so have proven themselves in practice, and thanks to the well-thought-out machine concept all the components are ideally tailored to each other. The high spare part availability makes it unnecessary for the user to maintain his own stock of parts, so maintenance work can be carried out rapidly and inexpensively.

The cold-water HP trailer provides a maximum water delivery quantity of 930 l/h and a pressure of up to 230 bar. The engines comply with the requirements of EU STAGE V and allow working independently of the mains power supply. The large tank and the low support load ensure a high level of user-friendliness. The cab version for stationary use has forklift pockets in order to facilitate transportation, and can be mounted on flatbeds or in vehicles.

Depending on the area of use, various options are available. The hose reel considerably facilitates handling and accommodates up to 50 metres of high-pressure hose. If work is being carried out with the Easy!Force Advanced trigger gun, the pressure regulation is especially ergonomic. The antifreeze system makes winter use absolutely risk-free. Protective devices for machine components are of interest in particular for rental fleets, as are the hour meter and the possible adjustment of the design. Upon the customer's request, the tank colour can be varied, and a customer logo can also be provided.
