

DUCAT-8 - convenience and functionality

15 July 2020 by Lozova Machinery

LOZOVA MACHINERY continues to expand the product range and presents an updated compact disc harrow DUCAT with a width of 8 meters.

The new harrow will please even the most demanding customers with its functionality and thoughtful technical solutions.

A significant advantage of the unit is the unique ZERO MAINTENANCE principle. There is no need to think about operating costs anymore, since DUCAT-8 has no lubrication points, even on hydraulic cylinder joints. All moving mechanisms of the harrow are equipped with plain bearings made of high-strength wear-resistant polymers. Application of reinforcing materials and special lubricants reduces friction and completely eliminates the lubrication of structures throughout the entire service life of the harrow.

According to numerous requests of farmers for more convenient operation, now it is possible to adjust the depth of the rollers in two ways. In addition to pin adjustment, the depth of roller penetration can be adjusted by means of hydraulics.

The useful features of the harrow include new system of folding to transport dimensions of 3x4 meters, as well as unique function of increasing ground clearance in the transport position by means of withdrawal of support wheel, that makes operation easier. Moreover, replacement rollers are available for different types of soils and conditions of agriculture, including complex ones.

In general, with DUCAT-8 farmers will reduce additional costs for maintenance of equipment, reduce the time of field works and minimize unproductive downtime due to repairs and maintenance.

Contact LOZOVA MACHINERY dealers and buy new DUCAT-8 already this summer.
