Kubota launches machine tracking system

1 September 2022 by Kubota

The U.K and Ireland's leading mini-excavator supplier, **Kubota**, has launched a new telematics portal to help construction equipment operators increase machine efficiency and security. The 'Kubota Tracking System' portal enables users to stay informed about the KX080-4a2 machines in their fleet, and can be accessed via a PC, laptop, tablet, or smartphone, meaning the data from a Kubota fleet can be seen anywhere at any time.

"As costs in other areas of construction rise, we are trying to develop new ways to help Kubota machine users understand where savings can be made and efficiency increased," says Rob White, Division Manager, Construction at Kubota UK.

"Our Kubota Tracking System, that's being launched on the KX080-4a2 initially ensures operators can access all the data from their machines at the touch of a button, allowing them to make informed decisions. This

includes considerations around servicing times and fleet movement, alongside additional benefits such as increased visibility of machines that helps with security.”

The intuitive and user-friendly portal shares informative data that helps users access operational performance and consider management decisions.

Enhanced security is provided as machine owners can view locations via GPS tracking to oversee the movement of each KX080-4a2 excavator. Furthermore, geofencing is available which allows users to designate specific areas of use for each machine, with the portal notifying you, should that machine leave the area.

The portal provides alerts which show a machine's faults enabling a fast response and resolution, thus minimising any downtime.

Increased productivity is achievable thanks to the constant review and analysis of real-time parameters of parts such as machine work rate, operating times, actual operation, occupancy rate (as a percentage), idling time, DPF regeneration history, water and oil temperatures, and fuel consumption.

“Having access to all this real-time data provides the opportunity for Kubota excavator owners to really streamline their processes and adapt fluidly to any and all situations,” concludes Rob.

For ultimate peace of mind, Kubota also offers a 5-year extended warranty on its machines via its Kubota Care programme. The offering ensures that the machine is cared for against any unforeseen extensive repair costs during the first five years of its life. What’s more, Kubota Care can be tailored to meet the exact requirements of operators, allowing them to decide the service hour usage and only pay for the hours they use.

The Kubota Tracking System portal is now available as standard on all Kubota KX080-4a2 excavators and will expand further throughout the range in the future. For more information on the portal, visit: [Kubota Tracking System](#).
