Kärcher with new high-pressure cleaner super class

With a total of twelve new products Kärcher overhauls its range of cold water high-pressure cleaners in the super class segment. With the HD 9/20-4 S, HD 10/21-4 S, HD 10/25-4 S and the HD 13/18-4 S there are four different product classes which are each available in three different configuration options. The new powerful machines for professional users are very ergonomic. Thanks to rotary nozzles with Vibrasoft function, vibrations are reduced by up to 30 percent in the "Plus" models, which makes particularly long work activities more comfortable.

The robust machines are suitable for removing heavy dirt, also in the agricultural sector or in the construction industry.

Depending on the version, the new models achieve a flow volume from 900 to 1,300 litres per hour as well as a working pressure of 250 bar and are therefore suitable for removing heavy dirt, including in the agricultural sector or in the construction industry. Robust pumps with ceramic-coated pistons and cylinder heads made from brass, as well as air-/water-cooled motors, ensure a long life of the machines, even under heavy use.

With the aid of the Easy!Force high-pressure gun, which uses the recoil force of the high pressure jet and thus reduces the holding force for users to zero, it is possible to work for long periods without suffering fatigue. With the servo control feature, users can comfortably adjust the water volume and pressure at the trigger gun. Rotary nozzles with Vibrasoft function also ensure that vibrations are reduced and the hands are well supplied with blood - this makes it easier for users to work for extended periods. The SXA models also have an automatic hose reel which facilitates the winding and unwinding of the hose, also under pressure.
