MCS Rental Software makes delivering rental equipment simple with new mobile features

26 May 2023 by MCS Rental Software

- MCS Rental Software releases two new features for rental companies
- Check-Out feature allows for easy tracking of rental equipment during delivery
- Third-Party Transport feature enables management of third-party transport deliveries and collections via mobile app

- what3words integration makes it easier to navigate to precise locations on construction or event sites
- Enhancements improve efficiency and customer service in the rental industry
- MCS continues to work towards empowering the rental industry with technology

MCS Rental Software has released two new features helping rental companies to efficiently get equipment out to their customers.

Without the check-out process, rental companies would typically have picked the rental equipment to be shipped from the depot, but wouldn't necessarily know what exactly was loaded onto a delivery vehicle. This is then made even harder to keep track of when using third-party haulage companies. With the new powerful combination of MCS Third-Party Transport and Check-Out, this process is now easily trackable with a clear record of what equipment is where, at all stages of the rental journey.

Nick Thomson, MCS Sales Director adds:

"MCS Check-Out is a great feature for Transport Managers to be able to see exactly what has been loaded onto a vehicle for shipping, especially necessary for rental companies where a different team member has picked the equipment to who is loading it for delivery. It can slot into each businesses processes differently but we have also introduced specific extensions to fit specific practises. For instance, making the Check-Out feature mandatory meaning personnel cannot move onto their next job without completing the process first."

Further to its new check-out feature, MCS Third-Party Transport feature enables hirers to manage third-party transport deliveries and collections via a mobile app. Third-party haulage drivers can now capture delivery signatures and take site photos that will instantly be available in MCS-rm, so that hirers can improve cash-flow and invoice customers much more efficiently.

Further enhancements within MCS Transport Mobile app include the latest what3words integration, making it even easier to navigate to a precise 3x3m location, especially useful for finding specific locations on large construction or event sites.

Nick Thomson concludes,

"Busy driver schedules are now more efficient whilst also improving customer service, with clear locations meaning customers receive their equipment on-time and to the right location."

With its latest enhancements to its mobile app offering, MCS continues to work towards empowering the rental industry to adopt technology to work smarter and achieve more.
