All-round talent: the MultiCarrier MC190

9 October 2025 by GROUP SCHUMACHER

- GROUP SCHUMACHER introduces the MultiCarrier MC190, a versatile carrier system for branch cutters and hedge trimmers.
- The MultiCarrier features a flexible D-Lock system, wide compatibility, collision protection, and user-friendly design elements.
- The radura® PrimeLine series is expanded with corn flail blades coated with tungsten carbide for superior wear resistance.

- Laser cladding technology enhances blade durability, cutting performance, and reduces fuel consumption during use.

XXL wear protection: corn flail blades with tungsten carbide coating

- New for tree and shrub care: MultiCarrier for branch cutter and hedge trimmer from SCH®
- Portfolio expansion of the radura brand® : PrimeLine corn flail blades with tungsten carbide wear protection coating

Powerful duo: The new MultiCarrier MC190 and SCH® branch cutter and hedge trimmer

In cooperation with the Ottersberg-based company Düvelsdorf, **GROUP SCHUMACHER** has developed a carrier system for its branch cutter and hedge trimmer which, thanks to the flexible D-Lock system, is suitable for mounting on a wide range of other carrier vehicles in addition to the Euro mount. The carrier system can be used with a working width of up to 1.93 m, has collision protection and a practical mechanical angle indicator that makes it easy to align the shears. The hydraulic hoses are securely routed in the boom arm, and counterweights can be mounted depending on the type of application. Very practical: the parking supports and the blade guard for the branch cutter or hedge trimmer can be carried along during work, so there are no loose parts.

Extremely durable: radura® PrimeLine corn flail blades with tungsten carbide wear protection coating

GROUP SCHUMACHER has expanded its portfolio in the PrimeLine series. PrimeLine stands for tungsten carbide-coated wear parts. Under the radura® brand, not only straw chopper knives but also corn flail blades with the exceptionally hard wear protection coating are now available. Laser cladding technology is used to apply the tungsten carbide particles to the surface, which significantly extends the service life of the products. In addition, cutting performance remains consistently high even with intensive use, the self-sharpening effect is improved, and fuel consumption is reduced.
