

BAUER Maschinen Group will be exhibiting at Bauma China 2014

9 September 2014 by BAUER Group

At the international trade fair Bauma China 2014, from 25 November to 28 November, BAUER Maschinen Group will again be showcasing new and innovative plant equipment and is looking forward to welcoming large numbers of visitors to its Stand A 06 / A13 in the open-air exhibition grounds. Its presence at this prestigious exhibition should also emphasize the commitment of Bauer to the regional market. Bauma China has not only become the most important trade fair for the Chinese market, but has also established itself as a major showroom and meeting place for the international construction machinery community.

The central focus will be given to rigs "engineered in Germany" and manufactured to the full company's quality standards in Bauer's own factories in Tianjin and Shanghai. Both factories have recently undergone a large-scale extension program to keep up with the increased demand. The machines leaving these facilities are sold not only in China but also exported throughout the entire Asian region, in the Middle East and in Latin America.

The BG series of rotary drilling rigs will form the primary highlight of the equipment display.

The requirements for an "optimum" drilling rig are extremely varied – and frequently even contradictory in nature. In many markets, the construction of boreholes by the uncased kelly drilling technique with extensive drilling depths or large drilling diameters is the dominant process. For this specific application Bauer has introduced a new drilling rig series – the "BG ValueLine".

It is a product line optimized for kelly drilling applications.

Two units of BG drill rigs out of the Tianjin factory will be on show. The BG 26 represents the best-selling medium sized machine. The new model BG 38 will be displayed as example of a high capacity kelly drilling machine with outstanding features such as: max. drilling depth of 90 meters, or max. drilling diameter of three meters.

Engineering and design of the whole BG product family is at the cutting edge of technology.

In addition, our engineers have come up with an extremely maintenance friendly design and an easy and cost effective product to operate.

Diaphragm walling equipment is the second highlight on the show. Two GB base carrier systems for hydraulic grabs will be showcased. The GB 46 is the best-selling standard model, while the GB 60 is the largest machine on the diaphragm wall market with a depth capacity of 80 meters. The grabs are equipped with special features such as a turning device and a flap steering system for maintaining verticality. For the operator's comfort a new Bauer operator cabin fitted with the latest B-Tronic screen & updated software will also be shown at the exhibition.

Bauer's well trained and competent sales engineers look forward to explaining and discussing the full range of our product line. KLEMM Bohrtechnik GmbH, a subsidiary of BAUER Maschinen GmbH, is specialized in versatile small diameter drilling rigs. One model of their KR series anchor drill is assembled in our Shanghai factory.

An outstanding type of equipment has been introduced in the Chinese market in 2014. Based on the experience in manufacturing well drilling rigs and deep drilling rigs for the oil and gas industry, our subsidiary company PRAKLA Bohrtechnik GmbH has built in close cooperation with the mother company BAUER Maschinen GmbH a "rescue rig". Six units of the type RB-T 90 have been sold to Chinese mining conglomerates. They serve as stand-by rigs and can be put in operation in case of emergencies in mining fields for drilling rescue shafts for the evacuation of miners.
